

In this episode we will get a glimpse  
of the power of KordsKontrol  
Polymorphic Poly Arpeggios

The background is a dense, abstract composition of numerous overlapping, semi-transparent geometric shapes, primarily squares and rectangles. These shapes are rendered in a variety of colors including shades of blue, teal, green, yellow, orange, red, purple, and grey. The shapes are scattered across the frame, creating a complex, layered visual effect that resembles a digital collage or a low-poly 3D environment.

In this episode, we will start to learn the features of the Poly Arpeggios sketch page,  
and use the Performance page to listen to the Arpeggios we have built.

We will also talk about Polyphony, and to finish, say a few words on Velocity humanization.

To navigate from the Chords progressions sketch page to the Poly Arpeggio sketch page, and later, to the performance page, you need to use the pages navigation buttons.

These buttons are used to select the Arpeggio you are editing.  
You can have up to 256 Arpeggios per session!

These buttons are used to navigate between the steps of the current Arpeggio (64 steps max.)

You can also navigate the steps directly using the pads in this grid.

This pad is a selector indicating that we are now editing Notes.  
A Poly Arpeggio can also contains CC or Drum notes,  
more on that in a next episode!

This pad can be used to change the  
velocity humanization of the Arpeggio notes.

And, last but not least, the pads in this grid are used to  
**input the notes** for each step.

You can change or reset the base octave here.

But why are we calling the Poly Arpeggios “Polymorphic”?

Because each note (or notes) you select for each step are not defined in an *absolute way* (let's say, a C in octave 2 (C2), or an E3 for example)

Instead, what you are really selecting when you input a note in the grid is **which note** of the current underlying chord you will play (bass = note #1, tenor = note #2, alto = note #3 or soprano = note #4), and at **which octave**.

Thus, the notes played in a given Arpeggio **depends** on the chord that is currently selected.

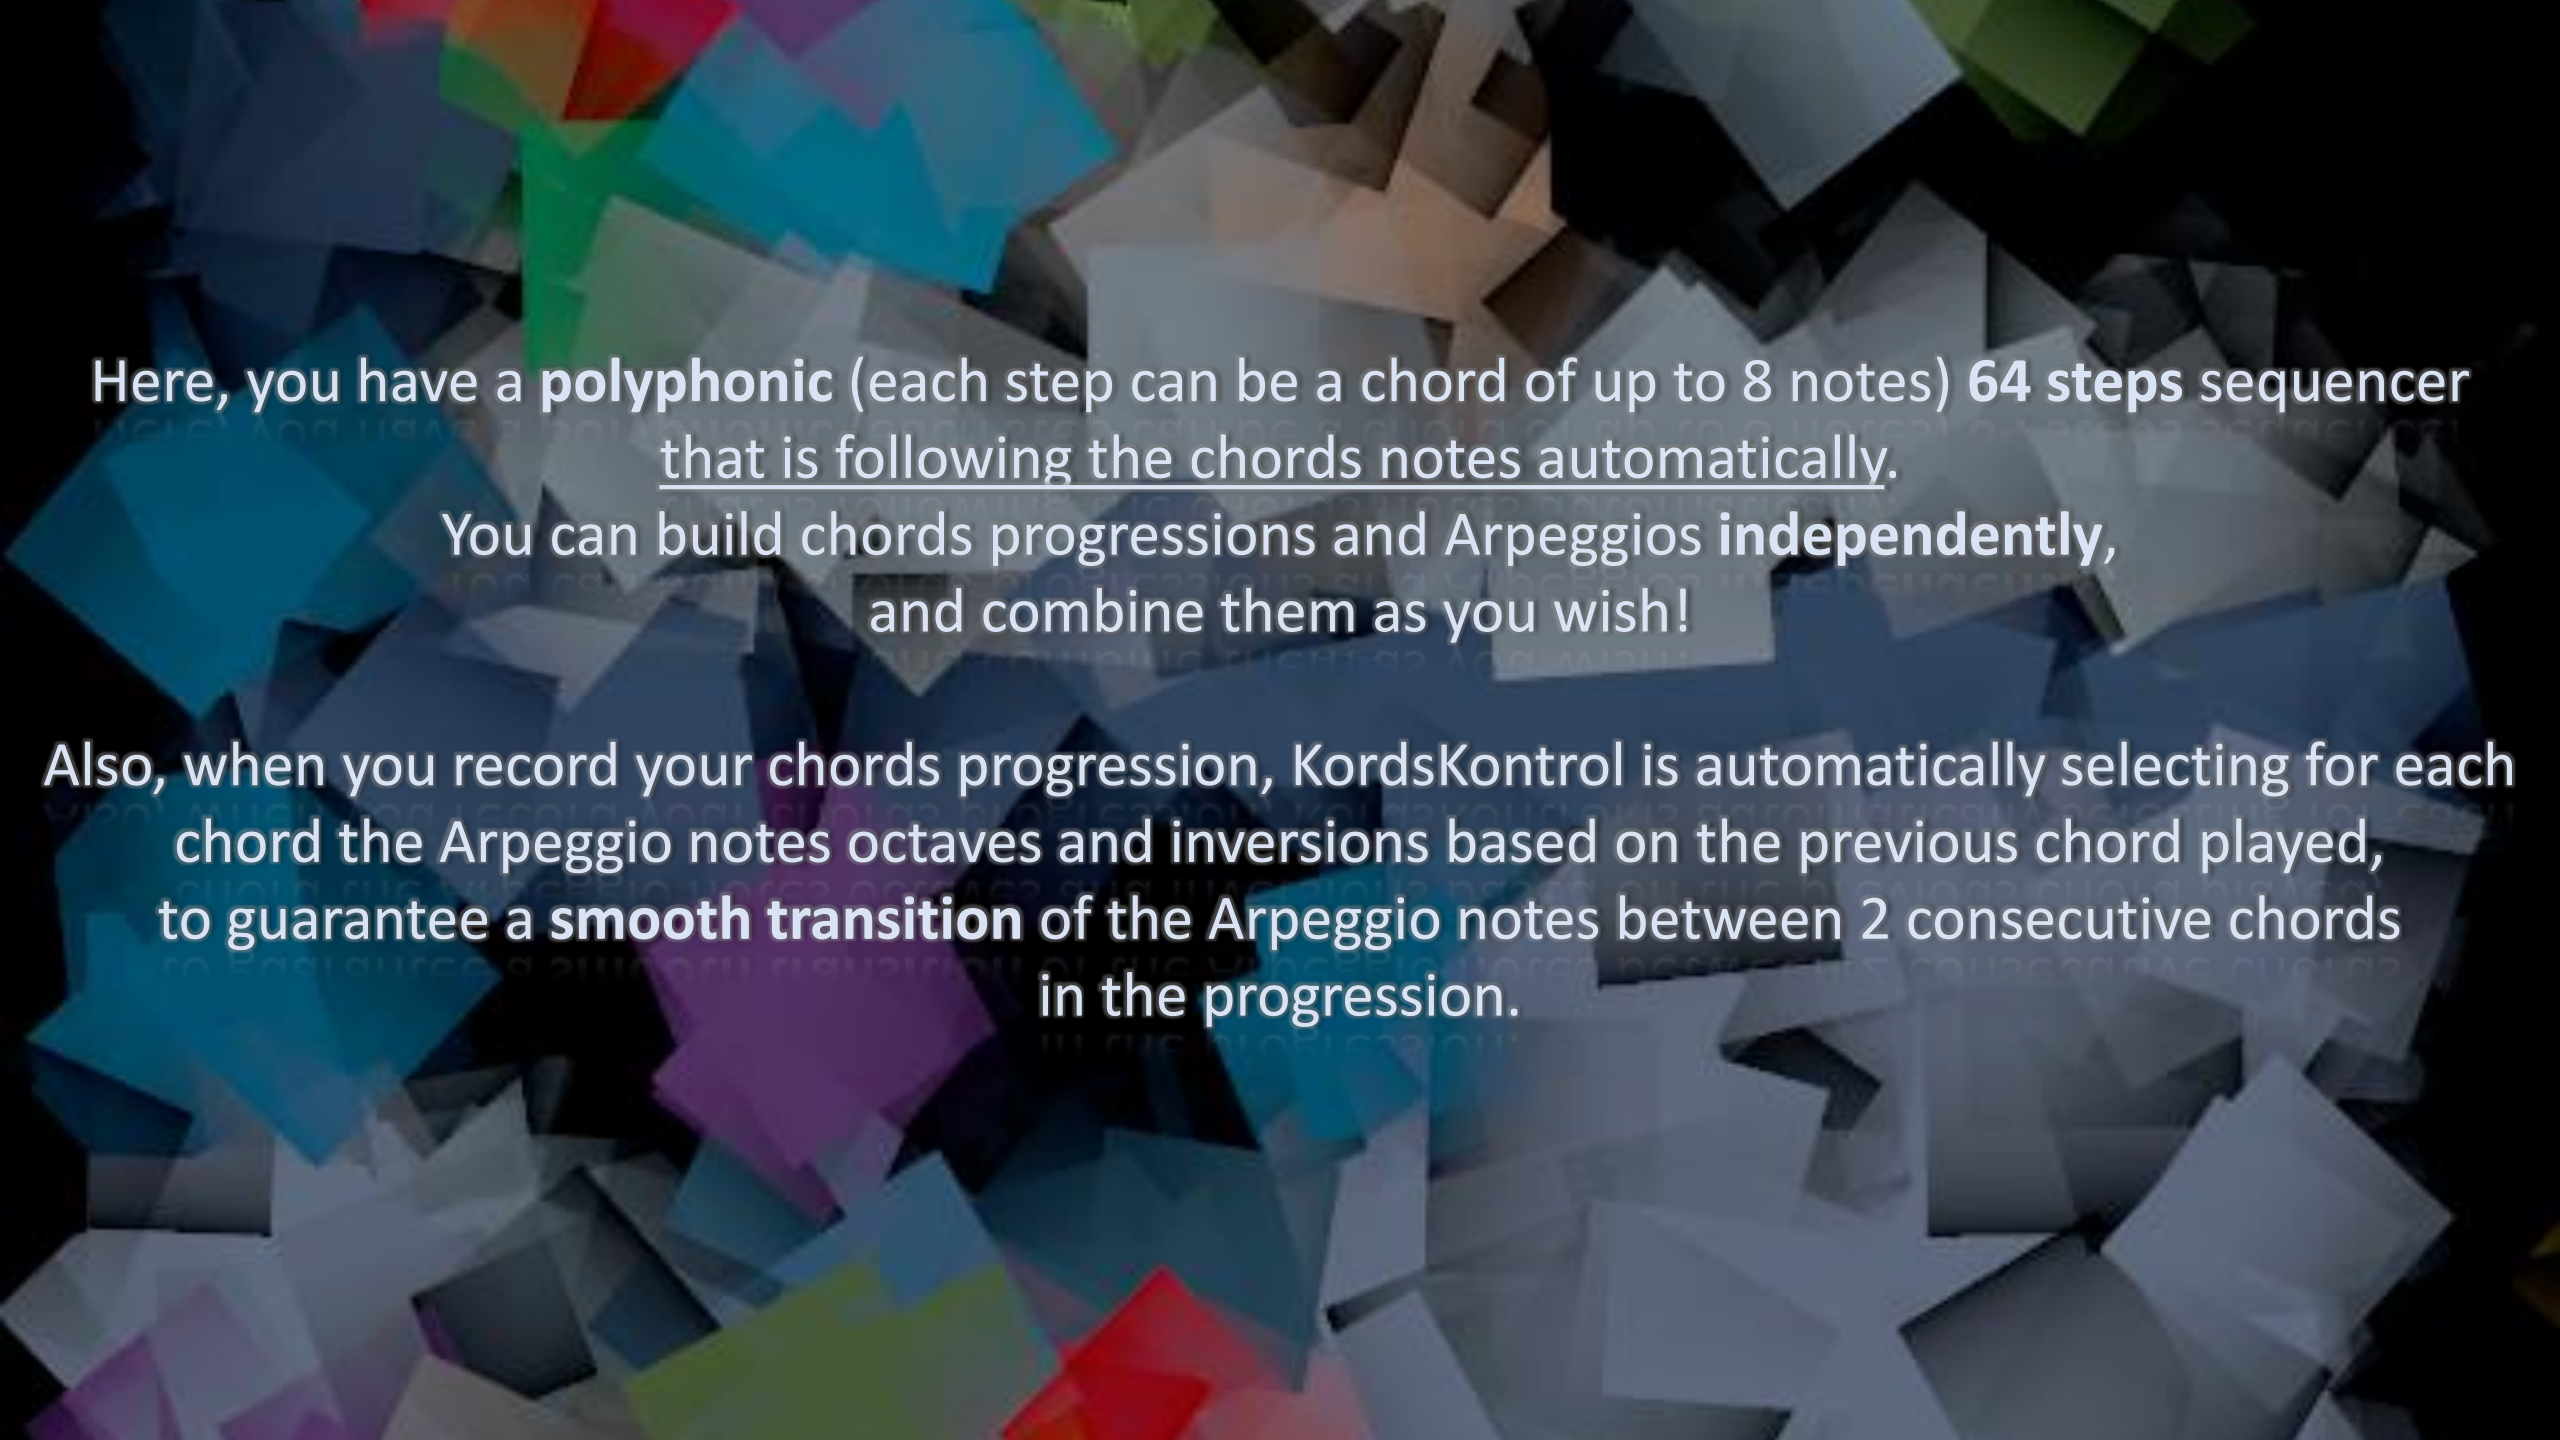

Arpeggios are constantly **changing their “shape”** to follow the chord progression you have built!

Many existing software/hardware feature sequencers, that allow a precise sequence of notes to be recorded. But this sequence is **fixed**, and will not follow your chords progression automatically.

Many existing software/hardware feature arpegiators, that follow the notes you play. But you are **limited** to basic sequences, like up/down, up 2 octaves etc..., and can play only 1 note at a time...

The background of the entire image is a dense, abstract composition of numerous overlapping, semi-transparent geometric shapes, primarily squares and polygons. These shapes are rendered in a wide variety of colors, including shades of blue, teal, green, yellow, orange, red, and purple, creating a vibrant, mosaic-like effect. The shapes are scattered across the frame, with some appearing more prominent than others, giving the background a sense of depth and movement.

Here, you have a **polyphonic** (each step can be a chord of up to 8 notes) **64 steps** sequencer that is following the chords notes automatically.

You can build chords progressions and Arpeggios **independently**, and combine them as you wish!

Also, when you record your chords progression, KordsKontrol is automatically selecting for each chord the Arpeggio notes octaves and inversions based on the previous chord played, to guarantee a **smooth transition** of the Arpeggio notes between 2 consecutive chords in the progression.

When you record a note in the grid, the velocity is automatically **recorded** also.

KordsKontrol has several way of playing Poly Arpeggios in the Performance page:

- **Manually** (you will have to hit the corresponding Arpeggio pad 1 time to trigger 1 step and go to the next step)

- **Automatically** (each step will be triggered following a clock)

There, trigger of a Poly Arpeggio pad can then be based on a:

- 'Toggle' mode (1 hit on the Arpeggio pad to play, 1 hit to stop)
- Or a 'Gate' mode (Arpeggio pad must be kept pressed to play)

**Manual** play allow to either use the **recorded** or the 'live' played velocity

**Automatic** play, when in 'Gate' mode, can use the aftertouch pressure to define velocity of the notes. In both 'Gate' and 'Toggle' modes you can also choose to use the **recorded** velocity.

The **velocity humanization applies** always, and is especially useful when using the **recorded** velocity to bring some **randomness** and **interest** to your Arpeggios

The background is a dense, abstract composition of numerous overlapping, semi-transparent geometric shapes, primarily squares and rectangles. These shapes are rendered in a variety of colors including shades of blue, teal, green, yellow, orange, red, and purple, set against a dark, almost black, background. The shapes are scattered across the frame, creating a complex, layered visual effect.

Now, we will put all this in practice.

First, we will listen to a pre-recorded chords progression.

Then, we will build a simple Arpeggio, and see how it evolves with the chords.  
This Arpeggio will be polyphonic: we will play 2 notes on each step.

The background of the entire image is a dense, abstract composition of numerous overlapping, semi-transparent geometric shapes, primarily squares and rectangles, in a variety of colors including shades of blue, teal, green, yellow, orange, red, and purple. The shapes are arranged in a way that creates a sense of depth and movement, with some appearing more prominent than others.

I hope you have found this video useful!

In the next episode, we will see how we can change the time signature and length of an Arpeggio to build

**Polymetric** and **Polyrhythmic** sequences.

To illustrate this, we will use several Arpeggios playing simultaneously on different MIDI channels.

We will also see how to change the length of a note for a given step.
